What systems, methods and technologies are needed to empower individuals and communities to become participants in local, healthy and sustainable food production?

Engaging in processes that regenerate rather than deplete, we become more alive.

*Five Principles of Ecological Design - Sim Van der Ryn and Stuart Cowen*

BACTERIA

x4

1gal water = 1lbs fish & 1lbs produce

2.5gal water = 1lbs fish & 1lbs produce

The technology associated with  
aquaponics is complex.

How can we make this technology more tangible?

# Edible Estates - Fritz Haeg

# User Identified Needs

**10/31/11**

***Excerpt of Email From Steve Kreuser***  
*(Hack Manhattan Member)*

To be honest, I am more interested in more 'traditional' forms of gardening. If given the keys to the roof and told to go wild, **I would work towards building an aesthetically pleasing, semi private place** for members to escape to from time to time. Unfortunately, with all the talk of geodesic domes and whatnot, that might not be what other folks have in mind.

However, I realize that growing a garden on the roof presents some very unique challenges, and as a result I am very interested in experimenting with hydroponics as well as living walls. (aquaponics is also something I have been researching recently, but I am not sure how feasible that is to do on a roof)

***Interview with Michelle Jackson***

*(Harlem Center for Healthy Living, Community Garden Member)*

“Collectively our members are interested in food access and social justice, through their own sources of food. They want to learn about new ways to create their own food sources and break their dependence on stores that don’t provide adequately for the community.”

***Excerpt From Jacob Cohen to Chris Piuggi***  
*(Urban Dweller, Agricultural Enthusiast)*

Basic info: We're got a 2nd fl apartment. The ground floor retail space extends back to the lot line and that gives us an extra 15-20' of outdoor space. It doesn't get a lot of light as the surrounding buildings are all very close and the building next to us about 8 or 9 floors.

I'm currently looking to solve a couple issues:

1. How to keep the plants alive during the winter (the greenhouse structure isn't well insulated)
2. How to collect and broadcast data from the plants
3. How to grow food in the space even during the winter

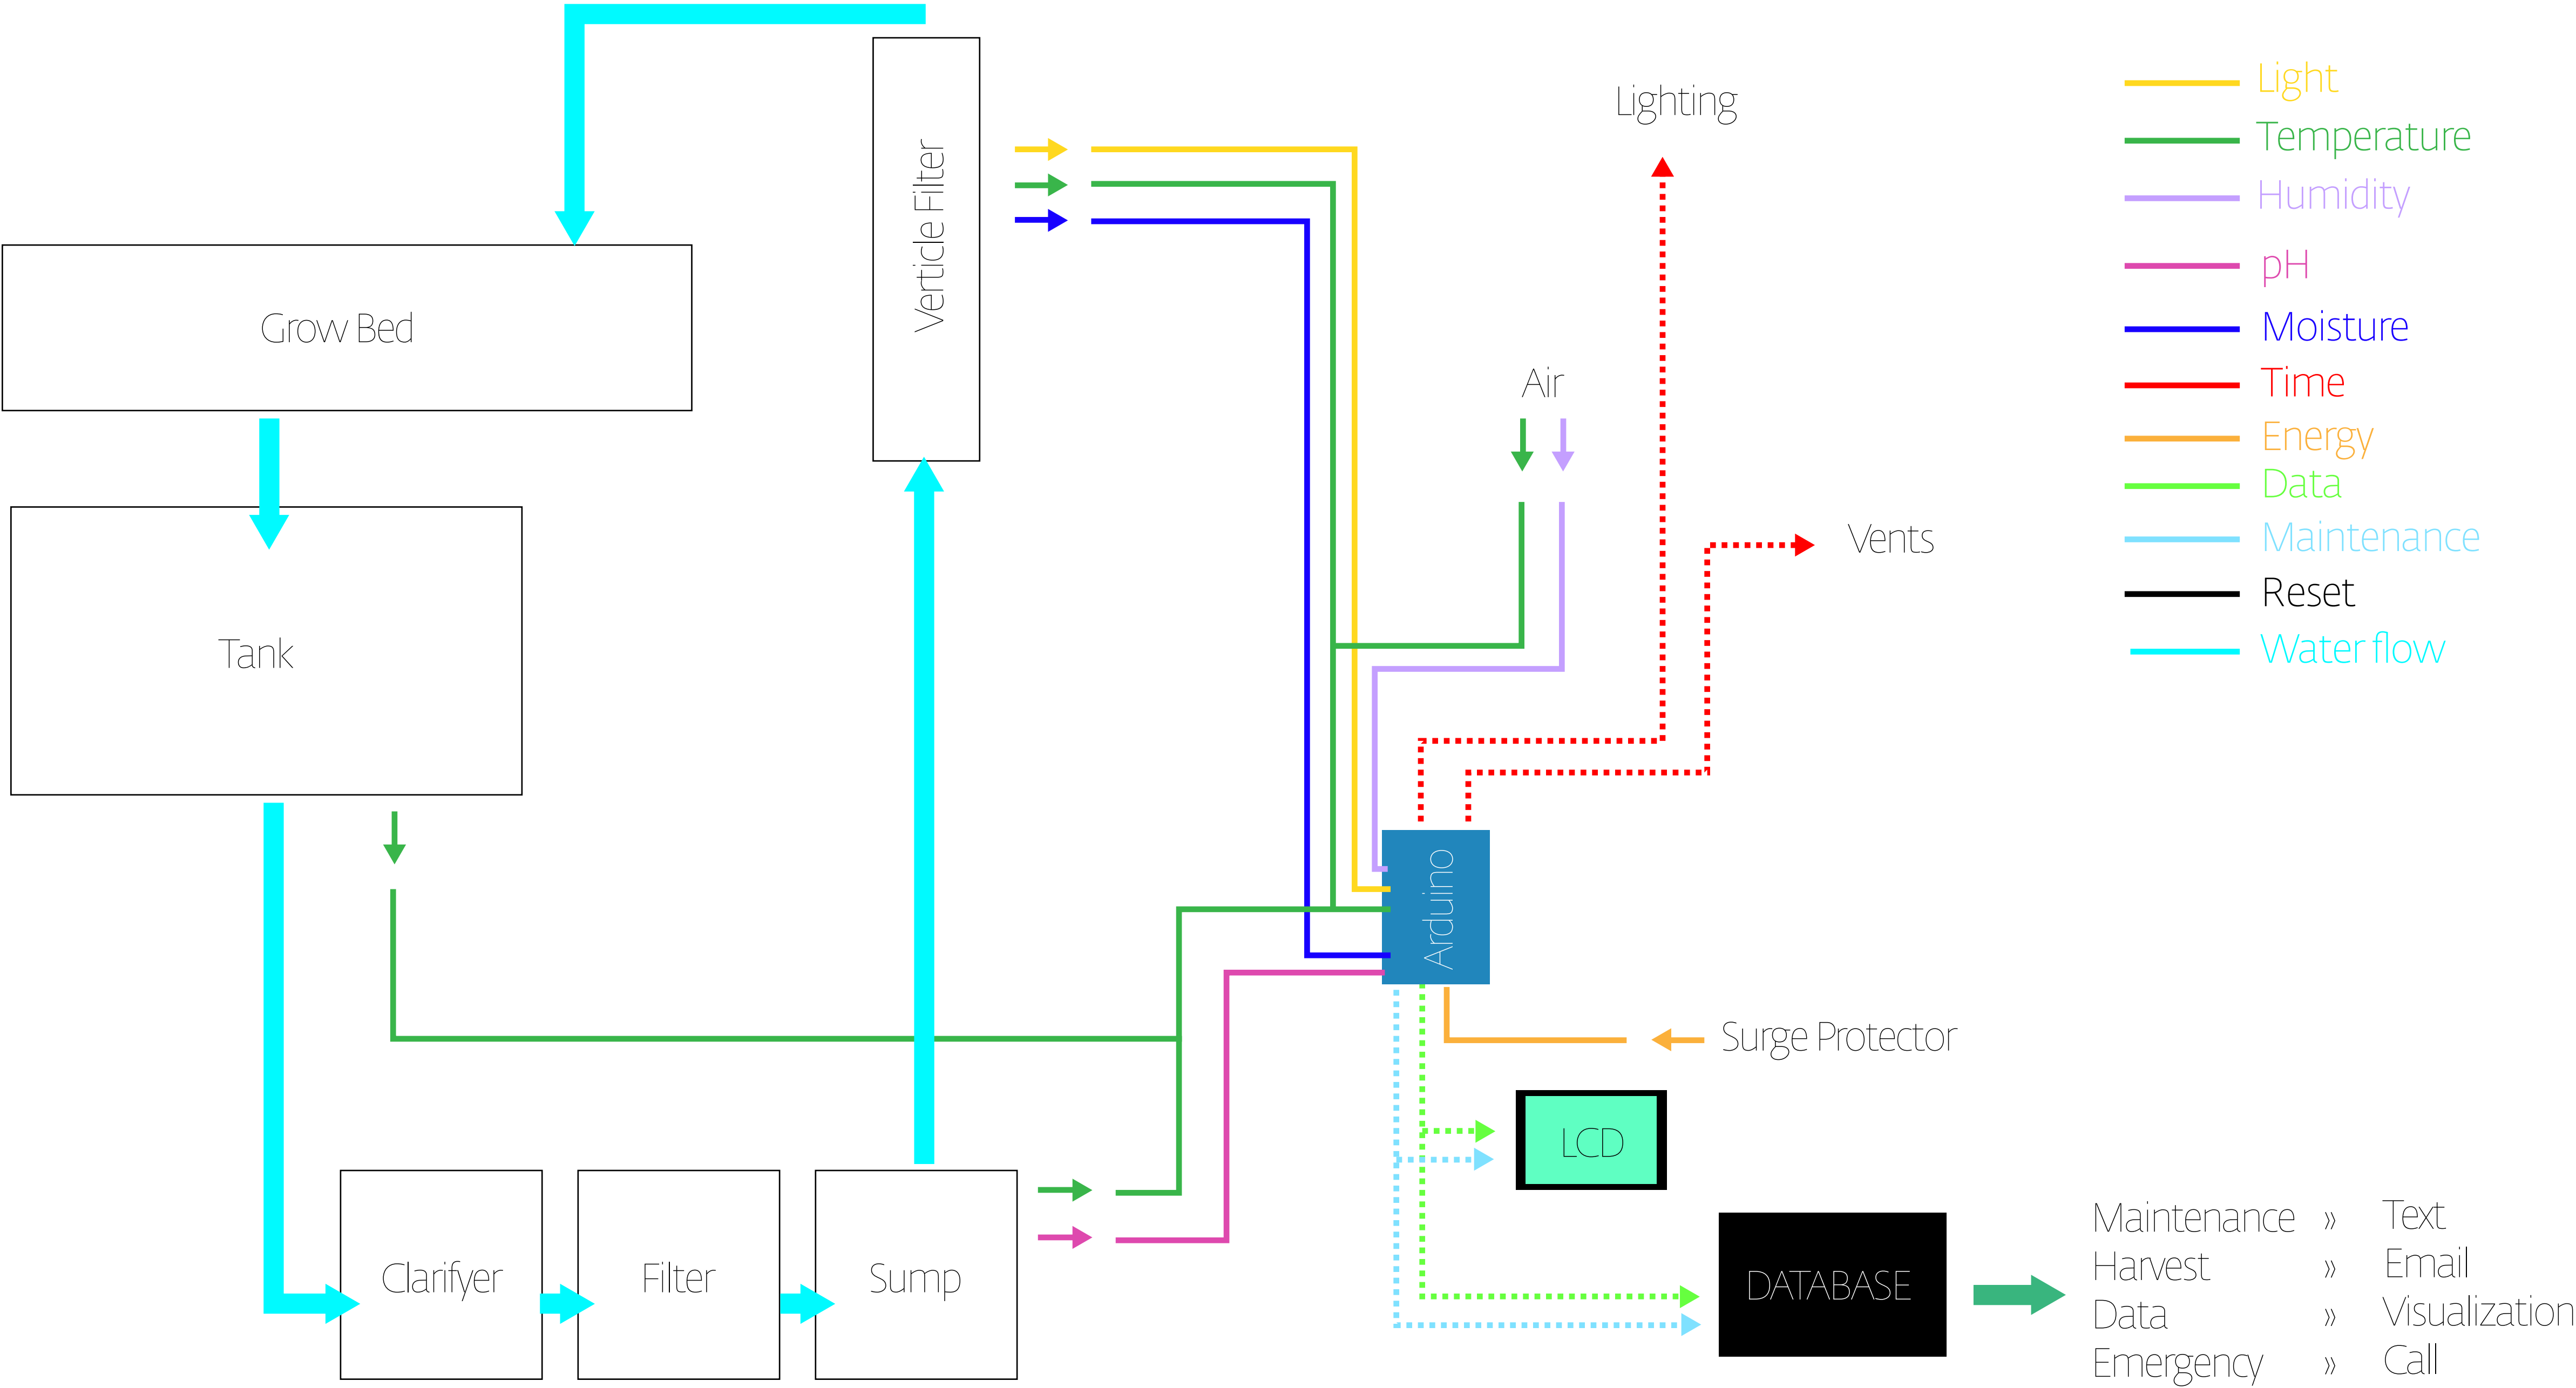

# ***Proposal***

Design methods for individual and community research, exploration and engagement within recirculating, sustainable eco-systems as a foundation to empower neighborhoods to cultivate healthy, self sufficient local economies.

Provide users with the ability to create and manage productive eco-systems via an interface to support users through data feedback.

Develop aesthetic solutions to integrate eco-systems  
everyday spaces, as a means for promotion,  
awareness and adoption.

Facilitate user implementation at scales which can be supported by resources available to participants.

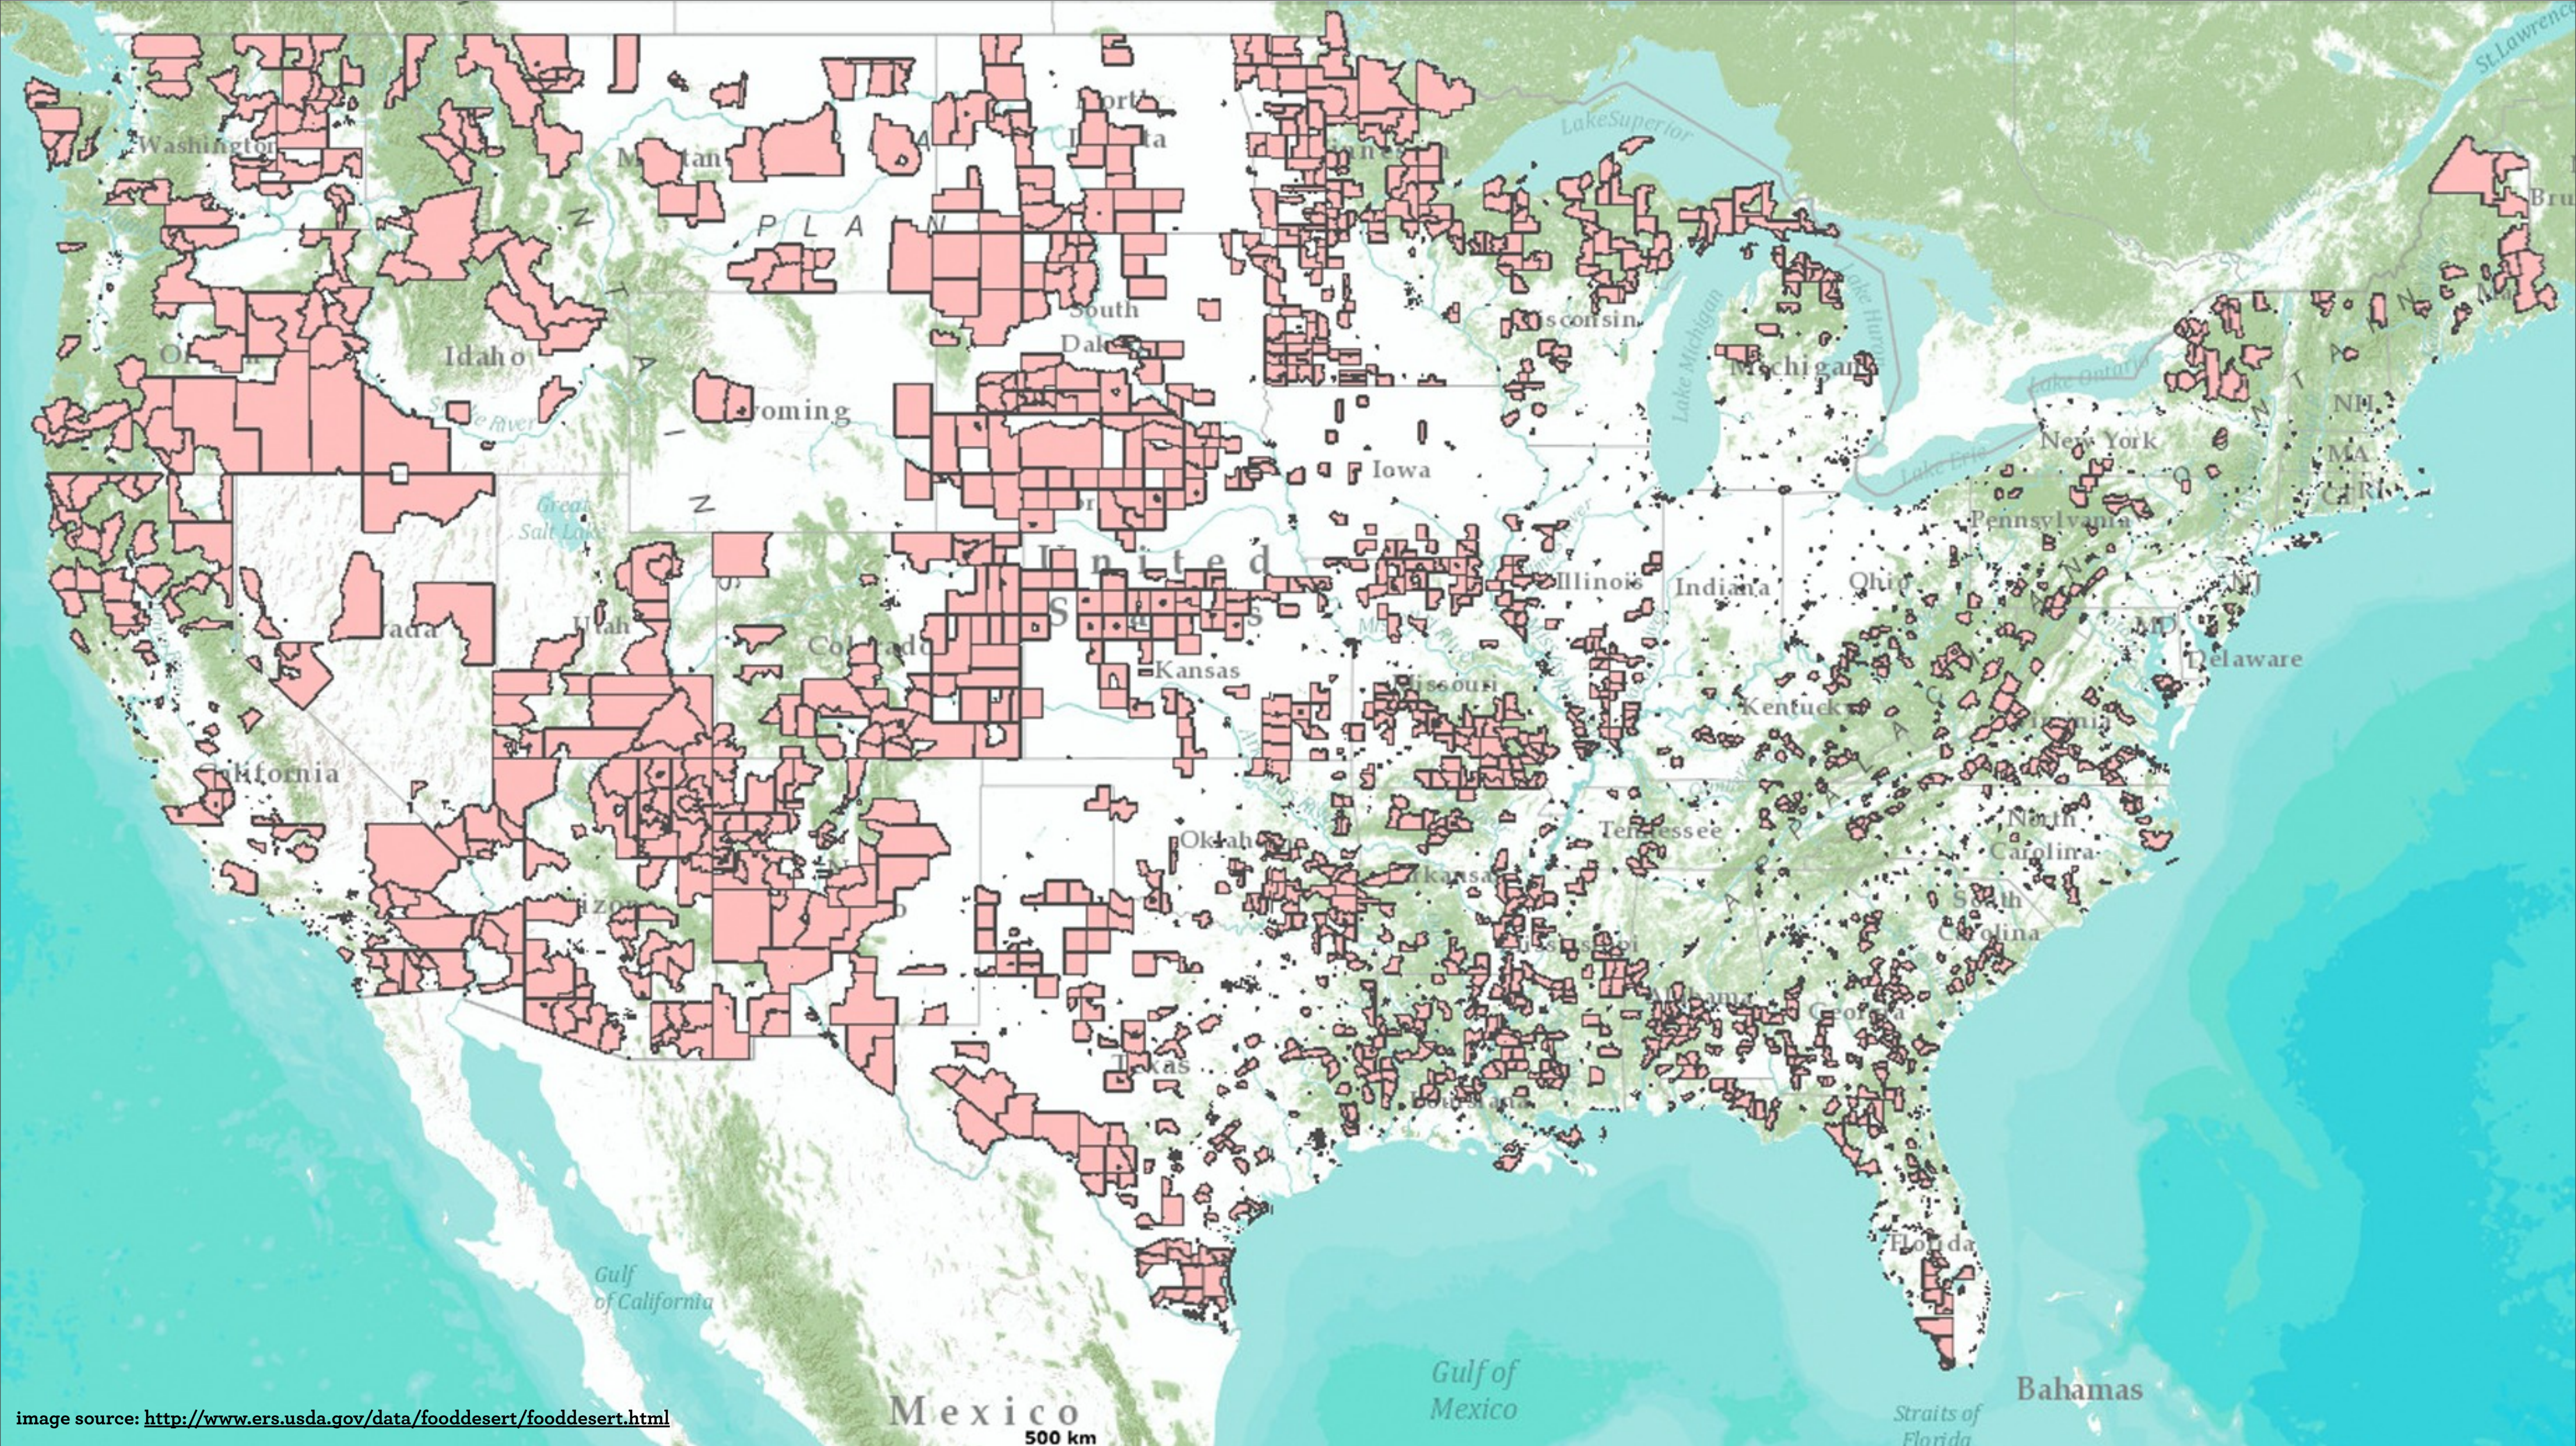

image source: <http://www.ers.usda.gov/data/fooddesert/fooddesert.html>

## ***Next Steps***

Create System in Public Space

Update Prototype Leaks

Implement Sensor Network

Creating documentation and support to facilitate  
user implementations

***Thank You.***
